Annex 2: Impact assessments under pillar 2 ‘reforming our energy system and protecting consumers’	37
Annex 3: Impact assessments under pillar 3 ‘ensuring the safety, security and resilience of the energy system’	37

Summary

The measures in this Energy Bill will provide a cleaner, more affordable and more secure energy system that is fit for the future. The measures will help deliver the commitments in the British Energy Security Strategy¹. The lead department for this Bill is the Department for Energy Security and Net Zero (“the Department”). The Bill is comprised of the three pillars below. More detail is available in section 1.1.

1. Liberating private investment in clean technologies
2. Reforming our energy system and protecting consumers
3. Ensuring the safety, security and resilience of the energy system

This Bill is expected to build a more secure, homegrown energy system that is cleaner and more affordable. Headline impacts are outlined below. More detail in section 2.

- **Primary legislation** in this Bill is estimated to have a **net benefit to society of around £280 million²**, despite an **annual net direct cost to business of around £10 million³**.
- Initial illustrative estimates suggest that the **secondary legislation** to implement the measures in this Bill will have a **significant additional net benefit to society**.
- For the measures where consumer bill impacts have been quantified, there is estimated to be a small average **annual energy bill cost of less than £1** for dual fuel households out to 2030. However, several policies help improve system efficiencies and therefore provide consumer savings in the long run. Wider impacts on bills from other policies are uncertain and depend on future funding decisions⁴.
- The Bill includes measures on heat network zoning and clean heat market mechanism, with estimated **greenhouse gas emissions savings of around 80 MtCO₂e⁵**, amounting to a social benefit of **around £15 billion⁶ based on HMG’s carbon values**.

² Net present value over 10-20 years depending on the appraisal period of the measure, 2020 prices, all measures discounted to 2022 irrespective of when they come into effect, rounded to the nearest million.

² Net present value over 10-20 years depending on the appraisal period of the measure, 2020 prices, all measures discounted to 2022 irrespective of when they come into effect, rounded to the nearest million.

³ Equivalent annual net direct cost to business (EANDCB), 2020 prices, 2022 present value base, rounded to the nearest million.

⁴ This estimate is subject to change because many of these savings will not be realised until secondary legislation stage and many policies have not quantified secondary legislation impacts yet. In addition, this estimate represents the average dual fuel household, but the final saving for consumers will depend on a) their level and pattern of energy consumption, b) their energy tariffs and c) whether they benefit from targeted measures. This will vary across households.

⁵ Million tonnes of carbon dioxide equivalent, rounded to one significant figure. Other measures may also lead to emissions savings but those emissions savings have not been quantified. The total emissions reduction has been aggregated across different appraisal periods depending on the policy.

⁶ 2020 price base, 2022 present value base, rounded to the nearest billion.

Of the 33 measures included in this Bill, only ten are expected to have direct impacts due to the primary legislation. The net present value (NPV)⁷ and equivalent annual net direct cost to business (EANDCB)⁸ for the measures that have primary legislation impacts are outlined in table 1. Estimates are in 2020 prices and all measures have been discounted to 2022 for comparison, irrespective of the date they come into effect. More detail is provided in section 2.1 and a full assessment is provided in the impact assessments listed in annexes 1-3.

Table 1: Summary of primary legislation impacts

	Policy measures	Primary legislation NPV ⁹	Primary legislation EANDCB ¹⁰
1.1	CO ₂ transport and storage regulatory investment (TRI)	-£14m	£1m
1.3	Hydrogen heating village grid conversion trial	Not quantified ¹¹	Not quantified
2.1	Special mergers regime for energy networks	-£180m ¹²	£8m
2.2	Energy industry code reform	-£16m	No business impacts
2.3	Multi-purpose interconnectors	>-£0.1m	<£0.1m
2.4	Defining electricity storage	>-£0.1m	<£0.1m
3.2	Final stages of nuclear decommissioning	£490m	No business impacts
3.3	Downstream oil resilience	£24m	<£0.1m
3.9	Pension reform for the Nuclear Decommissioning Authority (NDA) estate	-£2m	No business impacts
3.10	Offshore wind environmental improvement package	-£23m ¹³	£2m

⁷ Net present value (NPV) is a generic term for the sum of a stream of future values (costs and benefits) that have been discounted to bring them to present value. A positive NPV represents a net benefit and a negative NPV represents a net cost.

⁸ The equivalent annual net direct cost to business (EANDCB) measures the direct annual costs and benefits to business or civil society organisations. It focusses on those impacts immediately felt by those businesses directly impacted by the regulatory change. A positive EANDCB represents a net cost and a negative EANDCB represents a net benefit.

⁹ 2020 prices, 2022 present value base

¹⁰ 2020 prices, 2022 present value base

¹¹ Qualitative impact assessment.

¹² This NPV is negative, yet there is an avoided transfer from consumers to energy network companies of an estimated £600 million. This is a benefit to consumers yet is not captured in the NPV as this is a transfer. Therefore, we expect this policy to protect consumers, which is its main objective.

¹³ This takes the average of -£2.7m to -42.7m. This NPV is negative as it has not been possible to monetise benefits at this stage.

TOTAL	£280m	£10m
--------------	--------------	-------------

The overarching rationale for the interventions in this Bill includes correcting the negative externalities of greenhouse gas emissions to enable clean energy, addressing equity concerns to ensure bills are affordable, and supporting provision of energy security to address the free-rider problem. More detail is provided in section 1.2 and the rationale for intervention specific to each policy is provided in the impact assessments listed in annexes 1-3.

1. Policy rationale

1.1 Policy background

The measures in this Energy Bill will pave the way for a cleaner, more affordable and more secure energy system that is fit for the future. The measures will help deliver on the commitments in the British Energy Security Strategy¹⁴. The impact assessments listed in annexes 1 to 3 provide the policy background, including specific objectives and the problem under consideration for each policy measure. These are available on the Energy Bill webpage.¹⁵ The Energy Bill is comprised of three key pillars:

- 1. Liberating private investment in clean technologies** to reduce emissions from industry, transport and potentially heat, and investing in homegrown industries to help reduce our exposure to volatile gas prices in the long-term.
 - The Bill makes provisions aimed at accelerating the growth of low carbon technologies in the UK, helping us to reduce emissions and secure UK energy needs. It aims to facilitate state-of-the-art business models for carbon dioxide (CO₂) transport and storage, industrial carbon capture (ICC) and hydrogen. This will enable the Government to provide investors with the certainty of long-term revenue to kick start and scale up these technologies, create new industries and transform our former industrial heartlands.
 - The Bill will enable the effective and safe delivery of a hydrogen village trial and ensure that consumers in the trial area remain protected.
 - The Bill enables the introduction of a new Low-Carbon Heat Scheme. The scheme – introducing a rising market standard for heat pumps as a proportion of fossil fuel boiler sales – will provide the UK’s world-leading heating appliance industry with the policy certainty and confidence to invest in ways to make heat pumps a more attractive and simpler choice for growing numbers of UK households.
 - Through this Bill, the UK will be the first country to legislate for fusion regulation, providing clarity on the regulatory regime for fusion energy facilities and removing uncertainty for the fusion industry.
 - We will legislate to extend the list of eligible fuel types that can be supported under renewable transport fuel orders to include two new types of low carbon fuels, further increasing the UK’s carbon savings on land, air and sea.

- 2. Reforming our energy system and protecting consumers** as we invest in new technologies and diversify our energy supply.
 - The Bill will establish a Future System Operator, an independent body with responsibilities in both the electricity and gas systems, ensuring efficient energy planning, enhancing energy security, minimising cost to consumers and promoting innovation.
 - Transitioning to a smart and flexible energy system is essential to improving energy security, reducing consumer bills, and meeting our targets for Net Zero.

¹⁵ Energy Bill Impact Assessments – available at: <https://bills.parliament.uk/bills/3311/publications>

¹⁵ Energy Bill Impact Assessments – available at: <https://bills.parliament.uk/bills/3311/publications>

- We are introducing smart-related measures to ensure the electrification of heat and transport can be delivered securely and at the lowest cost to consumers. We are continuing to drive industry progress on the smart meter rollout which is set to deliver a £6 billion net benefit to society.
- We are also legislating to overhaul the way that the technical and commercial rules of the energy system are governed to enable innovation and ensure they can meet the pace of change required to deliver Net Zero.
- This Bill will enable competition in onshore electricity networks, delivering up to £1 billion savings for consumers by 2050.
- The Bill will also bring forward powers for heat networks. By appointing Ofgem as the new regulator for heat networks, we will ensure consumers get a fair price and a reliable supply of heat. By enabling heat network zoning in England, this will overcome barriers to deployment that the heat network market currently faces and ensure this sector can contribute to delivering net zero in the most cost-effective way.
- The Bill will strengthen the Energy Savings Opportunity Scheme to improve the quality of energy audits for large organisations which provides business with cost-effective recommendations on energy efficient measures.

3. Ensuring the safety, security and resilience of the energy system.

- We will reduce the risk of fuel supply disruption by giving Government the power to give directions to require information from, and provide financial assistance to, the core fuels sector to ensure resilience and continuity of fuel supply.
- The Bill will support the Government's ambition to deliver up to 50GW of offshore wind electricity generation by 2030 by amending the Habitats Regulations Assessment process for all projects making applications from late 2023. This will help reduce the time it takes to develop new offshore wind projects, whilst maintaining high environmental standards.
- The Bill will ensure that the Government's oil and gas regulatory regime continues to have high standards of habitats protection and pollution response as new technologies such as CO2 Storage are developed.
- In line with the polluter pays principle, the Bill will allow the Government to more fully recover the costs associated with regulating offshore oil and gas decommissioning activities from the oil and gas industry saving the taxpayer from picking up any shortfall.
- The Bill will allow the North Sea Transition Authority to identify and discourage potentially undesirable changes of control of carbon storage and petroleum licensees before they happen rather than having to remedy them after they have already taken place.
- The Bill will also facilitate the safe, and cost-effective clean-up of the UK's legacy nuclear sites, ensuring the UK is a responsible nuclear state by legislating on the licensing of geological disposal facility.
- The Bill will allow for more proportionate regulation of decommissioned nuclear sites when radiological hazards and risks to people's health and the environment are low.
- Through this Bill we will support and help nuclear deliver its important role and remove potential barriers to future investment by enhancing our nuclear third

party liability regime through the UK's ascension to the Convention on Supplementary Compensation for Nuclear Damage.

- This Bill will introduce legislation to enable the Civil Nuclear Constabulary to utilise their resources to support the security of other critical national infrastructure.
- The Bill will also bring Nuclear Decommissioning Authority pensions into line with wider public sector pensions in moving from a final salary scheme to a career average scheme.

On territorial extent and application, this Bill primarily extends and applies UK-wide, with some measure extending only to GB and a small number to England and Wales only or England only.

1.2 Rationale for intervention

The overarching rationale for intervention is to ensure that our energy system is secure, clean and affordable. Given the large number of policies, the specific rationale for intervention varies widely across the measures in the Bill. The rationale for intervention specific to each policy is contained in the individual impact assessments available on the Energy Bill webpage.

- **Energy security – quasi-public good.** Energy security is non-excludable because once energy security is provided, it is not possible to exclude individuals from benefitting from it. This leads to a free-rider problem, whereby individuals can benefit from energy security without contributing towards its cost. In a free market, firms may not provide a socially optimal level of energy security as they have difficulty recouping the cost of doing so (given it's not possible to exclude people from its benefits). Therefore, in the absence of government intervention, energy security is likely to be under-provided.
- **Affordable energy – equity considerations.** The cost of energy makes up a higher proportion of total income for those on lower incomes compared to those on higher incomes. This causes equity concerns given energy is a necessity good that is needed for basic human existence, providing a rationale for government intervention.
- **Clean energy – greenhouse gas emissions are a negative externality.** The overarching rationale behind government action to decarbonise energy is to correct the negative externalities of emissions. Government intervention is needed to address the social cost of emissions from the production of energy from unabated fossil fuels. In the absence of government intervention, energy from unabated fossil fuel sources would be over-produced due to the private costs of their production being lower than the social costs, which include pollution costs borne by wider society.

1.3 Options considered

The policy options considered, including alternatives to regulation, are outlined in each of the impact assessments available on the Energy Bill webpage. Where appropriate, policies include a long list and short list of options and consideration of non-regulatory options.

2. Summary of impacts

This section summarises the policies and their key impacts (section 2.1), consumer impacts (section 2.2), security of energy supply impacts (section 2.3), emissions impacts (section 2.4) and small and micro business impacts (section 2.5). This Bill primarily extends and applies UK-wide, with some measure extending only to GB and a small number to England and Wales only or England only.

2.1 Policies and key impacts

Table 2 describes each of the policies in this Bill, their impacts, net present value (NPV), and equivalent annual net direct cost to business (EANDCB). The NPV and EANDCB are in 2022 present value terms and all metrics are in 2020 prices. Only ten policies in the Bill have direct impacts as a result of the primary legislation. These are outlined in the bullets below and are included in table 2. The NPV and EANDCB estimates are only indicative of the impacts of possible secondary legislation, meaning a further impact assessment would be required at secondary legislation stage. Therefore, most policies fall under scenario 2¹⁶ according to the Regulatory Policy Committee (RPC) primary legislation impact assessment guidance,¹⁷ unless no secondary legislation is expected. Column 2 of table 2 below also outlines which policies are regulatory provisions or non-regulatory provisions.

Policies that have direct impacts due to this primary legislation:

- 1.1: CO₂ transport and storage regulatory investment (TRI)
- 1.3: Hydrogen heating village trial (no impacts)
- 2.1: Special merger regime for energy network companies
- 2.2: Energy industry code reform
- 2.3: Multi-purpose interconnectors (MPIs)
- 2.4: Defining electricity storage
- 3.2: Final stages of nuclear decommissioning
- 3.3: Core Fuels Sector resilience
- 3.9: Pension reform for the Nuclear Decommissioning Authority (NDA) estate
- 3.10: Offshore wind environmental improvement package

¹⁶ Scenario 2 is where departments provide an indication of the likely scale of impacts but are unable to provide a robust assessment for validation until the secondary legislation stage.

¹⁷ Regulatory Policy Committee (2019), RPC case histories – primary legislation IAs, <https://www.gov.uk/government/publications/rpc-case-histories-primary-legislation-ias-august-2019>

Primary legislation in this Bill is estimated to have a **net benefit to society of around £280 million**¹⁸ and an **annual net direct cost to business of around £10 million**¹⁹. This has been calculated using the impact assessment calculator²⁰, which sums the NPVs and EANDCBs of each of the policies that have impacts from primary legislation. This has been calculated in 2020 prices and discounted to 2022. The appraisal period varies across policies, with a minimum of 10 years and a maximum of 20 years. The monetised benefits of each of the policies with primary legislation impacts are unrelated and therefore we do not expect any duplication of benefits in the total NPV from primary legislation. A total NPV from secondary legislation has not been provided due to a high degree of uncertainty, but initial illustrative estimates suggest that the secondary legislation enabled through this Bill could have a significant net benefit to society. Some NPVs presented in table 2 are negative. A footnote is provided explaining why this is the case for each negative NPV, but the overarching reasons are a) it has not been possible to monetise benefits at this stage and b) benefits will materialise with secondary legislation and have not been quantified at this stage. We expect a net benefit to society once these are considered.

The methodology, evidence base and models used to monetise impacts for each of the policies is outlined in the impact assessments listed in annexes 1-3. Most policies have conducted a cost-benefit analysis over a 10-year appraisal period or longer where appropriate. More detail on how consumer impacts and emissions impacts have been estimated is provided in section 2.1 and 2.4 respectively.

Table 2: Summary of all policies in the Bill and key impacts

Policy	Description	Impacts	Metrics ²¹
Pillar 1: Facilitating investment in new technologies			
1.1	CO₂ transport and storage regulatory investment (TRI) [Regulatory provision]	This policy introduces a regulatory and licensing regime to operate CO ₂ transport and storage (T&S) networks and allows	<p>Costs:</p> <ul style="list-style-type: none"> Familiarisation & legal costs to T&S companies Ofgem costs Implementation costs <p>Benefits:</p> <ul style="list-style-type: none"> Enables deployment of a CO₂ T&S network Emissions savings
			<p>Primary legislation:</p> <p>NPV: -£14m²²</p> <p>EANDCB: £1m</p> <p>Secondary legislation impacts not estimated</p>

¹⁸ Net present value (NPV), 2020 prices, all measures discounted to 2022 irrespective of when they come into effect, rounded to the nearest billion.

¹⁹ Equivalent annual net direct cost to business (EANDCB), 2020 prices, all measures discounted to 2022 irrespective of when they come into effect, rounded to the nearest million.

²⁰ BEIS (2013), Impact assessment calculator, <https://www.gov.uk/government/publications/impact-assessment-calculator--3>

²¹ NPVs and EANDCBs are rounded to the nearest million, presented in 2020 prices, and discounted to 2022 irrespective of when the measure comes into effect. Appraisal periods vary depending on the policy.

²² This NPV is negative because a) benefits won't be realised until secondary legislation stage and b) it has not been possible to quantify emissions savings at this stage, which will represent the majority of the monetised benefits of the policy. We expect the NPV of this policy to be positive once benefits from secondary legislation are quantified.

Policy	Description	Impacts	Metrics ²¹	
	government support provision to T&S network operators.	<ul style="list-style-type: none"> • Reduced costs for energy intensive industries • Protection of jobs and output 		
1.2	Fusion regulation [Non-regulatory provision]	This policy will amend the Nuclear Installations Act 1965 to exclude fusion energy facilities from being considered nuclear installations.	Clarity for industry, investors, and the public on the fusion regulatory framework	No primary or secondary legislation impacts
1.3	Hydrogen heating village grid conversion trial [Regulatory provision]	This policy will enable the delivery of a hydrogen heating village grid conversion trial in a safe, timely, and cost-effective way while maintaining consumer protection.	Costs: <ul style="list-style-type: none"> • Potential disruption where extended gas network powers are invoked • Small potential increased consumer engagement costs for gas networks Benefits: <ul style="list-style-type: none"> • Increased certainty for gas networks • Increased likelihood the trial will take place and the conversion process will be timely, efficient, and safe • Time off gas minimised for consumers taking part in the trial • Consumers protected 	No primary or secondary legislation impacts estimated
1.4	Hydrogen and industrial carbon capture	This policy will enable financial assistance and counterparty powers to	Costs: <ul style="list-style-type: none"> • Levy costs to businesses and consumers 	No primary or secondary legislation impacts estimated

Policy		Description	Impacts	Metrics ²¹
	(ICC) business models [Non-regulatory provision]	support the hydrogen and ICC business models, including powers which facilitate competitive allocation in the future.	<ul style="list-style-type: none"> Administration and familiarisation costs to business and the delivery body Benefits: <ul style="list-style-type: none"> Emissions savings Air quality improvements Cost savings from fuel switching Jobs supported 	
1.5	Hydrogen levy powers [Non-regulatory provision]	This policy enables the creation of a dedicated hydrogen levy as set out in the Net Zero Strategy.	Costs: <ul style="list-style-type: none"> Levy costs to businesses and consumers Administration and familiarisation costs to business and the delivery body Benefits: <ul style="list-style-type: none"> Emissions savings Air quality improvements Cost savings from fuel switching Jobs supported 	No primary or secondary legislation impacts estimated
1.6	Clean heat market mechanism [Regulatory provision]	This policy enables an obligation on, for example, gas and oil heating appliance manufacturers, to increase sales of low-carbon appliances such as heat pumps.	Costs: <ul style="list-style-type: none"> Familiarisation costs Higher capital costs for low-carbon heating Change in energy demand costs Compliance costs Benefits: <ul style="list-style-type: none"> Increased low-carbon heating installations Emissions savings 	No impacts from primary legislation. Secondary legislation (illustrative): NPV: -£500m ²³ EANDCB: £11m-£360m

²³ This illustrative NPV is negative because a) there are significant benefits related to decarbonising heat which it has not been possible to quantify, b) it does not capture benefits from other policies which this policy enables and c) conservative, highly sensitive assumptions are used. We expect this NPV would be positive if these were captured.

Policy		Description	Impacts	Metrics ²¹
			<ul style="list-style-type: none"> Air quality improvements Innovation benefits 	
1.7	<p>Supporting nuclear derived fuels (NDFs) and recycled carbon fuels (RCFs) through the Renewable Transport Fuel Obligation (RTFO)</p> <p>[Non-regulatory provision]</p>	<p>This policy will amend the RTFO to also support nuclear derived fuels (NDFs) and recycled carbon fuels (RCFs), incentivising use of NDFs and RCFs and reducing emissions.</p>	<p>Costs:</p> <ul style="list-style-type: none"> Ongoing costs (where the total cost equals the cost of buyout minus the cost of supplying RCFs) Loss of revenue to government Administration costs <p>Benefits:</p> <ul style="list-style-type: none"> Emissions savings Improved air quality Waste diverted from landfill Support for the emerging advanced fuels industry 	<p>No impacts from primary legislation.</p> <p>Secondary legislation (illustrative):</p> <p>NDFs NPV: not quantified</p> <p>RCFs NPV: £700-2,000m</p> <p>NDFs & RCFs EANDCB: N/A. This is a non-regulatory provision due to the tax and spend mechanism of the RTFO and therefore is exempt as detailed in section 22 of the SBEE Act.</p>
Pillar 2: System reform and consumer protection				
2.1	<p>Special merger regime for energy networks</p> <p>[Regulatory provision]</p>	<p>This policy will strengthen Ofgem's regulatory ability and protect consumers by providing the Competition and Markets Authority (CMA) with further powers when considering energy network company mergers.</p>	<p>Costs:</p> <ul style="list-style-type: none"> Administration and familiarisation costs Foregone efficiency gains to network companies Potential increase in emissions from the gas/electricity sector Reduced revenue for network companies <p>Benefits:</p> <ul style="list-style-type: none"> Lower network charges for consumers – estimated £2 reduction 	<p>Primary legislation:</p> <p>NPV: -£180m²⁴</p> <p>EANDCB: £8m</p> <p>No secondary legislation expected</p>

²⁴ This NPV is negative, yet there is an avoided transfer from consumers to energy network companies of an estimated £600 million. This is a benefit to consumers yet is not captured in the NPV as this is a transfer. Therefore, we expect this policy to protect consumers, which is its main objective.

Policy	Description	Impacts	Metrics ²¹	
		<p>in the average annual dual fuel energy bill</p> <ul style="list-style-type: none"> Avoided deadweight loss 		
2.2	<p>Energy industry code reform [Regulatory provision]</p>	<p>This policy will a) create a body that provides strategic direction across energy codes and b) create an empowered code manager function.</p>	<p>Costs:</p> <ul style="list-style-type: none"> Increased Ofgem costs Learning and familiarisation costs <p>Benefits:</p> <ul style="list-style-type: none"> Cost savings to industry due to fewer consultations Reduced delays to code modifications Reduced entry barriers for smaller firms 	<p>Primary legislation: NPV: -£16m²⁵ EANDCB: £0m</p> <p>Secondary legislation (illustrative): NPV: -£280m²⁶ EANDCB: £33m²⁷</p>
2.3	<p>Multi-purpose interconnectors [Regulatory provision]</p>	<p>This policy introduces a new licensable activity for multi-purpose interconnectors (MPIs) under the existing regulatory regime, enabling MPI developers to obtain MPI-specific licenses from Ofgem.</p>	<p>Costs:</p> <ul style="list-style-type: none"> Familiarisation costs for existing non-MPI electricity licence holders <p>Benefits:</p> <ul style="list-style-type: none"> Increased legal clarity for MPI developers Potential for increased interconnection capacity Potential for lower capital and operating costs for interconnection capacity Facilitate coordination of offshore infrastructure 	<p>Primary legislation: NPV: >-£0.1m²⁸ EANDCB: <£0.1m</p> <p>No impacts expected from secondary legislation</p>

²⁵ This NPV is negative because only smaller, peripheral benefits have been deemed possible to monetise, whilst all major costs of the policy have been monetised. This NPV should therefore be considered in parallel with non-monetised benefits.

²⁶ This illustrative NPV is negative because only smaller, peripheral benefits have been deemed possible to monetise, whilst all major costs of the policy have been monetised. This NPV should therefore be considered in parallel with non-monetised benefits.

²⁷ This estimate is illustrative and is not referenced in the full impact assessment (annex 2.2) because an EANDCB has not been submitted for validation at this stage given uncertainty around the secondary legislation.

²⁸ This NPV is negative as it includes familiarisation costs only.

Policy	Description	Impacts	Metrics ²¹
<p>2.4</p> <p>Defining electricity storage [Regulatory provision]</p>	<p>This policy will define electricity storage as a distinct subset of generation in the Electricity Act 1989.</p>	<p>Costs:</p> <ul style="list-style-type: none"> • Familiarisation costs <p>Benefits:</p> <ul style="list-style-type: none"> • Increased investor confidence • Reduced risk of legal challenge • Cost savings for industry – legal advice no longer required to clarify the position of storage • Increased number of electricity storage projects 	<p>Primary legislation impacts:</p> <p>NPV: >–£0.1m²⁹</p> <p>EANDCB: <£0.1m</p> <p>No secondary legislation expected</p>
<p>2.5</p> <p>Smart metering rollout [Regulatory provision]</p>	<p>This policy extends powers to make licence and industry code modifications for the smart meter rollout from a current expiry of 1 November 2023 to a new expiry of 1 November 2028.</p>	<p>Costs:</p> <ul style="list-style-type: none"> • Costs for energy suppliers to purchase of metering assets • Installation costs • Operation, maintenance, and IT costs to suppliers <p>Benefits:</p> <ul style="list-style-type: none"> • Energy savings for consumers • Lower consumer bills • Emissions savings • Lower customer service costs for energy suppliers • Maintains flexibility in the energy system 	<p>No primary or secondary legislation impacts estimated</p>
<p>2.6</p> <p>Future system operator [Regulatory provision]</p>	<p>This policy creates a new independent future system operator (FSO), who will be able to drive progress</p>	<p>Costs:</p> <ul style="list-style-type: none"> • Cost to purchase assets • Implementation costs • Potential loss of synergies between the gas system operator 	<p>No impacts from primary legislation.</p> <p>Secondary legislation (illustrative):</p> <p>NPV: £10m–£2,900m, mainly dependent on</p>

²⁹ This NPV is negative as it includes familiarisation costs only.

Policy		Description	Impacts	Metrics ²¹
		towards net zero while maintaining energy security and minimising costs for consumers.	<p>function and transmission assets</p> <p>Benefits:</p> <ul style="list-style-type: none"> Enhanced roles and responsibilities of the FSO Greater ‘whole-system’ co-ordination and decision making 	future electricity system cost savings due to a “whole system” view.
2.7	<p>Smart secure energy systems (SSES)</p> <p>[Regulatory provision]</p>	This policy will require organisations undertaking relevant “load control” activities to obtain a licence from Ofgem and comply with any licence conditions and codes attached to that licence.	<p>Costs:</p> <ul style="list-style-type: none"> Compliance costs for licensees Ofgem costs to enforce licenses Technical infrastructure costs <p>Benefits:</p> <ul style="list-style-type: none"> Increased uptake of demand side response (DSR) Reduced costs of maintaining energy system stability Protection against unfair treatment of consumers 	No primary or secondary legislation impacts estimated.
2.8	<p>Smart heat pumps</p> <p>[Regulatory provision]</p>	This policy seeks powers to mandate that all electric space heating appliances sold in GB have smart functionality. Appliances in scope are heat pumps, storage heaters and heat batteries.	<p>Costs:</p> <ul style="list-style-type: none"> Familiarisation and transition costs Manufacturing costs Increased customer service requirement Enforcement and infrastructure costs <p>Benefits:</p> <ul style="list-style-type: none"> Electricity system benefits from increased flexibility Lower consumer bills Emissions savings Accelerated innovation and investment 	<p>No impacts from primary legislation.</p> <p>Secondary legislation (illustrative):</p> <p>NPV: Not estimated</p> <p>EANDCB: £19m</p>

	Policy	Description	Impacts	Metrics ²¹
2.9	Heat network zoning [Regulatory provision]	This policy will see heat networks deployed in areas in England where they are the lowest cost, low carbon heating solution.	<p>Costs:</p> <ul style="list-style-type: none"> • Capital costs to deploy heat networks • Costs to designate heat network zones • Compliance costs • Disruption costs <p>Benefits:</p> <ul style="list-style-type: none"> • Net energy savings as heat networks are more efficient • Supply chain development • Jobs and GVA benefits • Increase in the deployment of low carbon heat networks • Emissions savings • Lower system costs 	<p>No impacts from primary legislation.</p> <p>Secondary legislation (illustrative):</p> <p>NPV: -£450m³⁰</p> <p>EANDCB: <£1m</p>
2.10	Heat network market framework [Regulatory provision]	This policy will a) specify a heat network regulator and their powers, b) define heat network consumer protection measures and c) define heat network statutory powers.	<p>Costs:</p> <ul style="list-style-type: none"> • Compliance costs for heat network businesses • Ofgem costs to be the regulator <p>Benefits:</p> <ul style="list-style-type: none"> • Improved consumer protection • Improved technical standards • Support in meeting decarbonisation targets • Extra rights and powers to heat network owners/operators 	<p>No impacts from primary legislation.</p> <p>Secondary legislation (illustrative):</p> <p>NPV: -£70m³¹</p> <p>EANDCB: £7m</p>
2.11	Energy company	This policy will remove current	<p>Costs:</p>	<p>No impacts from primary legislation.</p>

³⁰ This illustrative NPV is negative because the following benefits have not been quantified – improved flexibility, supply chain improvements due to a strong signal of government ambition, jobs supported and GVA. In addition, impacts are uncertain at this stage and will be finalised at secondary legislation stage.

³¹ This illustrative NPV is negative because benefits of the policy are not monetised at this stage, so this NPV should be considered in parallel with non-monetised benefits.

Policy	Description	Impacts	Metrics ²¹
<p>obligation 4 (ECO4) buyout mechanism [Regulatory provision]</p>	<p>size-based supplier thresholds for ECO and will introduce a buy-out mechanism to ensure smaller suppliers can meet their ECO obligations without facing disproportionately high costs.</p>	<ul style="list-style-type: none"> Costs for newly obligated suppliers Potential reduction in ECO4 benefits if buy-out results in less energy efficiency measures delivered, which may have bill impacts <p>Benefits:</p> <ul style="list-style-type: none"> Lower obligation on average for existing ECO4 suppliers Reduced delivery costs for existing obligated suppliers Improved competition as current market distortions are removed 	<p>Secondary legislation (illustrative):</p> <p>NPV: -£1m to -£90m³²</p> <p>EANDCB: <£1m</p>

2.2 Consumer impacts

The impact on both domestic and non-domestic energy bills will depend on underlying energy prices and the future design of the specific measures that this primary legislation enables. The final saving for domestic and non-domestic energy consumers depends on various factors such as their level and pattern of energy consumption, their energy tariff, and whether they benefit directly from targeted measures. This will vary across households and businesses. Many of the savings will also not be realised until secondary legislation stage and given the inherent uncertainties in their use, many policies do not have quantified secondary legislation impacts yet. The figures below therefore present a partial picture and are subject to change. The first section covers domestic (household) consumer impacts whilst the second section covers non-domestic (business) consumer impacts.

Domestic consumer impacts

The below estimates are presented as average impacts across households (e.g. targeted policies are assumed to be spread equally across all households) with illustrative assumptions on future gas and electricity prices used to calculate the saving on the bill. Any costs are spread equally across all relevant consumption.

The bullets below summarise the domestic consumer impacts of measures in this Bill. More detail is provided in the impact assessments listed in annexes 1-3.

- Policies designed to increase competition between network companies reduce domestic consumer bills.** This includes both the special merger policy (annex 2.1) and the onshore electricity competition policy (annex 2.13) which are designed to reduce energy network costs through competition. This results in savings for all consumers,

³⁴ Only the cost of the primary legislation have been monetised leading to a negative NPV.

³⁵ Only the cost of the secondary legislation have been monetised leading to a negative NPV. The exact details of the secondary legislation are undefined, so potential illustrative options have been used.

estimated to be around £2 for the average dual fuel household per year for the special merger policy and around £1 for the average dual fuel household per year for the onshore electricity competition policy.

- **Smart energy policies help to reduce domestic consumer bills.** Smart energy policies, such as the energy smart appliances measure (annex 2.12) will support the roll-out of these flexible technologies, helping users manage or reduce their bills by shifting electricity demand automatically to times of the day when energy is cheaper. However, these benefits are dependent on other factors such as the availability of time-of-use tariffs, smart meters, and demand side response service. In addition, the smart meter rollout measure (annex 2.5) ensures the rollout of smart meters continues at pace, delivering the benefits identified in the 2019 smart meter roll out cost-benefit analysis³⁶, which estimates a 3% reduction in electricity consumption.
- **Policies that strengthen regulations for future energy security, decarbonisation and consumer protections may marginally increase domestic consumer bills in the short-term, but with potential consumer savings in the long run.** The creation and delivery of new energy code functions through Ofgem (annex 2.2) and the creation of a new independent future system operator (FSO) (annex 2.6) will both likely require upfront costs that are passed on to consumer electricity bills. Together these schemes could add around £2 to the average household electricity bill out to 2030 but are also expected to enable greater efficiencies in the long run as the system is decarbonised. This could result in greater savings for consumers in the long run, but these benefits have not been quantified. The development of a heat network regulator and its powers (annex 2.9) will involve costs that, if recovered through all gas and electricity consumers, could increase the average bill by £1 out to 2030. However, given this will also set out heat network consumer protections it could result in savings for heat network consumers in the long run.
- **Some policies are intended to directly support decarbonisation but, at this stage, are too uncertain to be able to say whether consumer energy costs would increase or decrease as a result.** The deployment of low carbon hydrogen (annex 1.5) is essential to meeting decarbonisation targets and reducing reliance on fossil fuels, yet this measure could place costs on suppliers and increase consumer bills. However, this depends on the future funding mechanism that is agreed.

The impacts on domestic consumers of measures included in the Bill will differ based on their household characteristics, meaning costs and benefits will differ across the consumer base. For example, adopting clean heat technology currently has high upfront capital costs, which may be a barrier to adoption for lower income households in the short run. However, policies in this area aim to drive market scale and promote long-term cost reductions in low-carbon heating, reducing this barrier in the longer term. Smart energy policies also have upfront costs, which may affect take-up in lower income households. However, these policies are designed to drive market scale and reduce costs in the long-term. A more detailed discussion on how benefits may differ across

³⁶ BEIS (2019), Smart meter roll-out: Cost benefit analysis, <https://www.gov.uk/government/publications/smart-meter-roll-out-cost-benefit-analysis-2019>

different consumer groups, and how these are potentially mitigated for individual measures, is included in the impact assessments listed in annexes 1-3.

Non-domestic consumer impacts

Non-domestic organisations, including businesses, voluntary sector organisations, and public sector organisations are also consumers of energy. The figures below relate to the average non-domestic or industrial consumer, yet in reality, the final impacts will depend on a number of factors including their energy consumption, tariff, and if the measure is directly targeting them. Overall, measures in this bill will seek to reduce the final energy bills faced by non-domestic consumers, benefitting them in the long run.

The bullets below summarise the non-domestic consumer impacts of measures in this Bill. More detail is provided in the impact assessments listed in annexes 1-3.

- **Policies designed to improve energy efficiency reduce non-domestic consumer bills.** For example, the ESOS (annex 2.16) could reduce non-domestic bills as improved audit quality could reduce energy consumption, resulting in bill savings for non-domestic consumers. This policy creates some initial installation costs to businesses, but this is required to realise the bill savings.
- **Policies designed to increase competition between network companies reduce non-domestic consumer bills.** This includes both the special merger policy (annex 2.1) and the onshore electricity competition policy (annex 2.13) which are designed to reduce energy network costs through competition. Some savings will also accrue to businesses, although network costs (and therefore estimated savings) make up a smaller proportion of non-domestic consumer's energy bills, with some large non-domestic businesses directly connected to transmission networks, meaning they do not face distribution costs.
- **Some policies are essential to move us towards greater energy security, as well as to meet decarbonisation targets, but may increase non-domestic consumer bills, at least in the short-term.** The deployment of low carbon hydrogen through a levy (annex 1.5) could place costs on suppliers and increase non-domestic consumer bills. However, this measure is essential for the energy transition and the exact bill increase is dependent on the future funding mechanism that is yet to be agreed. Smaller businesses (including SMBs) have higher baseline energy costs in £/MWh terms than larger businesses. This means that the consequent increase in gas and electricity prices would make up a smaller proportion of smaller businesses' baseline costs.

2.3 Impacts on security of energy supply

Currently, the capacity market helps to ensure security of electricity supply and the highly diverse and flexible sources of gas help to ensure security of gas supply. This Bill will further strengthen energy security by establishing a Future System Operator and ensuring smart energy. The bullets below summarise some of the energy security impacts of measures in the Bill. More detail is provided in the impact assessments listed in annexes 1-3.

- **Establishing a Future System Operator (FSO) increases energy security.** Currently, National Grid Electricity System Operator (ESO) is responsible for ensuring the stable and secure operation of the electricity system. The FSO policy in this Bill (annex 2.6) will establish a new independent FSO with enhanced roles and responsibilities, which will strengthen the System Operator's ability to ensure energy security.
- **Smart energy policies increase energy security.** Smart energy policies can help strengthen energy security by shifting electricity demand to off-peak times when there is low demand on the electricity system such as overnight, or to times of high renewable electricity generation. This flexible form of charging can reduce or defer costly investment in additional electricity generation capacity and network reinforcement and help balance the electricity system. This applies to all smart energy policies in the Bill, including the smart meter rollout (annex 2.5), smart secure energy systems (annex 2.7), smart heat pumps (annex 2.8), energy smart appliances (annex 2.12) and smart electric vehicle charge points (annex 2.14).
- **Policies designed to incentivise the shift from gas heating to low-carbon heating will increase energy security.** For example, the clean heat market mechanism policy (annex 1.6) incentivises the switch from gas and oil boilers to electric heat pumps, which consume significantly less energy for the same heat output. A reduction in gas and oil use increases energy security.
- **Speeding up the consenting period for offshore wind will increase energy security.** The offshore wind environmental improvement package (annex 3.10) will review the habitats regulation assessment (HRA) with the aim of speeding up the consenting period for offshore wind. This will shorten the time it takes to deploy offshore wind and help increase the speed at which the power sector is decarbonised, increasing energy security.

2.4 Emissions impacts

The Bill includes measures on heat network zoning and clean heat market mechanism, with estimated **greenhouse gas emissions savings of around 80 MtCO₂e³⁷**, amounting to a social benefit of **around £15 billion³⁸ based on HMG's carbon values**. Many of these savings will not be realised until secondary legislation stage and many policies have not quantified secondary legislation impacts yet. These figures should therefore be interpreted as illustrative as they only present a partial picture and are subject to change at secondary legislation stage. In addition, the appraisal period varies between policies and there is a risk of duplication in summing the emissions estimates across both primary and secondary legislation. This is because, whilst we know primary legislation benefits are unrelated, there is still uncertainty around secondary legislation benefits this early in the policy-making process.

³⁷ Million tonnes of carbon dioxide equivalent, rounded to one significant figure. Other measures may also lead to emissions savings but those emissions savings have not been quantified. The total emissions reduction has been aggregated across different appraisal periods depending on the policy.

³⁸ 2020 price base, 2022 present value base, rounded to the nearest billion.

Whilst the figures above illustrate the total order of magnitude of emissions savings from this Bill, policies in this Bill impact emissions in different ways. Emissions impacts for some policies are outlined in table 2 and a full assessment is provided in the impact assessments listed in annexes 1-3. The bullets below summarise some of the emissions impacts.

- **Policies designed to incentivise the shift from gas heating to low-carbon heating will reduce emissions.** For example, the clean heat market mechanism policy (annex 1.6) incentivises the switch from gas and oil boilers to electric heat pumps which will reduce emissions. The clean heat market mechanism policy will save an estimated 19 MtCO₂e of carbon emissions in the central deployment scenario (corresponding to an estimated benefit of £3.6bn³⁹) over the lifetime of the low-carbon heating appliances installed under the policy⁴⁰.
- **Policies designed to support carbon capture operators will reduce emissions.** The hydrogen and industrial carbon capture (ICC) business models policy (annex 1.4) will enable financial assistance to support ICC business models, whilst also including powers to facilitate future competition. The CO₂ transport and storage regulatory investment (TRI) policy (annex 1.1) will allow government to provide support provisions to transport and storage (T&S) operators. These policies will allow for the meeting of HMG's ambition to capture and store 20-30Mt of CO₂ per year by 2030.
- **Policies which encourage the roll-out of hydrogen technologies will reduce emissions.** For example, the hydrogen and industrial carbon capture (ICC) business models policy (annex 1.4) and the hydrogen levy powers policy (annex 1.5) both enable financial assistance to support businesses in the hydrogen sector, which will lead to a reduction in emissions. Currently, we do not have estimates for emission savings from these two policies, as these benefits will only be realised once the policy is implemented at the secondary legislation stage.
- **Speeding up the consenting period for offshore wind could reduce emissions.** The offshore wind environmental improvement package (annex 3.10) will review the habitats regulation assessment (HRA) with the aim of speeding up the consenting period for offshore wind. This will support achieving 50GW of offshore wind capacity by 2030 and ensure clean offshore wind capacity comes online sooner. This will support the transition to renewable energy and reduce emissions.
- **Amending the Renewable Transport Fuel Obligation (RTFO) to include nuclear derived fuels (NDFs) and recycled carbon fuels (RCFs) will reduce emissions.** The RTFO measure (annex 1.7) will enable NDFs and RCFs to be part of the RTFO, offering the potential to reduce emissions by substituting a portion of petrol and diesel emissions with materials made from fossil-derived wastes that would otherwise be landfilled or incinerated.

³⁹ 2020 price base, 2022 present value base, rounded to the nearest 100 million.

⁴⁰ Secondary legislation impact, as the primary legislation will have no impact on emissions.

2.5 Small and micro business impacts

Of the 33 policies included in this Bill, only 4 policies are expected to result in costs for small and micro businesses (SaMBs) at primary legislation stage and 4 policies are expected to result in proportionately higher costs on SaMBs at secondary legislation stage but have no impacts at primary legislation stage. For these policies, more detail is provided in the bullets under the headings below. These policies have been highlighted because a) they are expected to result in costs for SaMBs at this primary legislation stage which is what the RPC are validating at this stage or b) they are expected to result in proportionately higher costs for SaMBs at secondary legislation stage which is highlighted as an important factor in the RPC small and micro business assessment guidance⁴¹.

The remaining 25 policies are less significant for this assessment because either a) they are not expected to result in costs or benefits to SaMBs at all (11 policies⁴²), b) it is too early to do a full assessment of the costs and benefits for SaMBs at secondary legislation stage but there are no costs or benefits at primary legislation stage (5 policies⁴³), c) they are expected to result in benefits for SaMBs at secondary legislation stage but there are no costs or benefits at primary legislation stage in most cases (3 policies⁴⁴), or d) they are expected to result in proportionate costs for SaMBs at secondary legislation stage but there are no costs or benefits at primary legislation stage in most cases (6 policies⁴⁵).

⁴¹ Regulatory Policy Committee (2019), RPC Small and Micro Business Assessment guidance, p.7.

⁴² '1.1 CO₂ transport and storage regulatory investment (TRI)' is not expected to impact SaMBs because CO₂ transport and storage networks are likely to be operated by large businesses. '1.2 Fusion regulation' is not expected to impact businesses as it is a clause that will confirm the status quo and remove ambiguity. '2.1 Special merger regime for energy network companies' is not expected to impact SaMBs as no energy network companies qualify as SaMBs, but SaMBs may indirectly benefit from reduced energy bills. For '2.3 Multi-purpose interconnectors', there are currently no licensees of operational interconnectors, offshore transmission assets or offshore wind assets that qualify as SaMBs, yet improving legal clarity could support SaMBs in attracting investment to scale up and become operational. '2.15 Energy performance of buildings' is not expected to impact businesses as it will replace an EU power and maintain the status quo. '2.16 Energy saving opportunity scheme (ESOS)' is not expected to impact SaMBs because ESOS applies to large businesses and their corporate groups only – where SaMBs are part of a corporate group, evidence suggests costs are incurred at the level of the large business rather than by SaMBs. '3.10 Offshore wind environmental improvement package' is not expected to impact SaMBs because no UK offshore wind developers were deemed to be SaMBs. '3.2 Final stages of nuclear decommissioning' and '3.9 Pension reform for the Nuclear Decommissioning Authority (NDA) estate' are not expected to impact businesses as the NDA is a public body. '3.5 Application to the territorial sea of requirement for nuclear site licence' is not expected to impact businesses because it is a legislative amendment that will confirm the status quo. '3.8 Civil nuclear constabulary (CNC)' is not expected to impact businesses because it applies to public bodies only.

⁴³ 1.4 Hydrogen and industrial carbon capture (ICC) business models, 1.6 Clean heat market mechanism, 1.7 Supporting NDFs and RCFs through the RTFO, 2.5 Smart metering implementation programme, and 2.8 Smart heat pumps.

⁴⁴ '2.13 Onshore electricity network competition' primary legislation has no impacts, but the secondary legislation is expected to reduce an entry barrier, enabling SaMBs to enter the electricity transmission network market, and may reduce bills for SaMB electricity consumers. '2.14 Smart chargepoints' primary legislation has no impacts, but the secondary legislation is expected to benefit SaMBs by providing greater clarification of roles and a reduction in responsibilities. '3.1 Accession to the CSC for nuclear damage' primary legislation is expected to benefit SaMBs by providing them with protection against claims from CSC contracting parties and encouraging SaMBs to be part of UK supply chains.

⁴⁵ '1.5 Hydrogen levy powers' primary legislation has no impacts, but the secondary legislation is expected to impose levy costs on all three major energy user groups (households, commercial users, and industry), some of

At this stage, no policies in the Bill have exempted SaMBs because this would prevent the benefits of the policy being realised in many cases. In addition, there are only two mitigations across the Bill at this stage – ‘2.11 ECO4 buyout mechanism’ includes a buyout mechanism to mitigate some impacts on the newly obligated suppliers to avoid disproportionately high costs and ‘3.3 Downstream oil resilience’ exempts forecourts that supply less than 1,000 tonnes per year, but ad hoc manual monitoring will still be required during periods of disruption. See the impact assessments listed in annexes 1-3 for a full assessment of SaMB impacts for each of the policies. As mentioned above, see below for the policies that are expected to result in costs for SaMBs at primary legislation stage or may result in proportionately higher costs on SaMBs at secondary legislation stage.

Policies that are expected to result in costs for SaMBs at primary legislation stage:

- **1.3 Hydrogen heating village trial** – This measure is likely to impact a very small number of SaMBs as it only applies to the Gas Distribution Network Operators (GDNs) conducting the trial and the trial involves only 1,000-2,000 properties. SaMBs within the trial area may experience some disruption but this is unlikely to be significant.
- **2.2 Energy industry code reform** – This measure is expected to impact many SaMBs, as SaMBs make up around 97% of firms in the electricity sector and around 82% of firms in the gas sector. At primary legislation stage, all businesses are expected to incur familiarisation costs of £1,200-£2,400 per business. This cost could be proportionately higher for SaMBs as they have a smaller customer base to spread these costs over. However, overall, we expect the small familiarisation costs (which are likely to be passed onto consumers) to be outweighed by ongoing benefits from lower costs of interacting with the codes and a quicker process.
- **2.4 Defining electricity storage** – This measure is expected to impact many SaMBs, as SaMBs make up around 97% of firms in the electricity sector. At primary legislation stage, all businesses are expected to incur a familiarisation cost only of around £270 per business. This cost could be proportionately higher for SaMBs as they have a smaller customer base to spread these costs over. However, this cost is very small and it is not possible to exempt SaMBs. In addition, SaMBs may benefit from cost savings from no longer having to procure legal services relating to the definition of storage.
- **3.3 Downstream oil resilience** – This measure applies to forecourts without automatic wet stock monitoring that supply more than 1,000 tonnes per year, which will impact some

which will be SaMBs, yet costs are not expected to be disproportionate as they are likely to be per-unit costs. ‘2.7 Smart secure energy systems’ primary legislation has no impacts, but the secondary legislation is expected to impose costs such as license costs on DSR firms and chargepoint operators, but these costs are not expected to be disproportionate because Ofgem’s 2021 license fee cost recovery principles ensure fees are based on market share. ‘2.11 ECO 4 buyout mechanism’ primary legislation has no impacts, but the secondary legislation is expected to impose costs on 10 new energy suppliers, only 2 of which are SaMBs, but buy-out is intended to mitigate some impacts on these suppliers to avoid disproportionately high costs. ‘3.4 Oil and Gas Authority (OGA) ex ante powers’ primary legislation is expected to impose costs on licensees, yet administrative costs are expected to be very small and should not disproportionately impact SaMBs ‘3.6 Offshore oil & gas (Habitats Assessment and Emergency Pollution Planning and Response)’ and ‘3.7 Offshore oil & gas decommissioning cost recovery’ primary legislation has no impacts, but the secondary legislation is expected to impose costs on offshore oil & gas businesses, yet costs are proportionate to their percentage field equity which would typically be smaller for SaMBs.

SaMBs. At primary legislation stage, businesses in scope are expected to incur costs to provide data to government. However, these costs will not disproportionately burden SaMBs because the data provision requirements will be proportionate to the business size. It is estimated that around 20-30% of the total annual cost of data collection will be borne by SaMBs, amounting to £40,000⁴⁶ over the appraisal period.

Policies that may result in proportionately higher costs for SaMBs at secondary legislation stage but have no impacts at primary legislation stage:

- **2.6 Future system operator** – This measure is expected to impact many SaMBs, as SaMBs make up around 97% of firms in the electricity sector and around 82% of firms in the gas sector. Whilst no impacts are expected at primary legislation stage, all businesses are expected to incur familiarisation costs at secondary legislation stage. This cost could be proportionately higher for SaMBs as they have a smaller customer base to spread these costs over. However, this policy aims to reduce entry barriers by removing the potential conflict of interest, which is likely to benefit SaMBs by enabling them to enter the transmission network market and reducing bills.
- **2.9 Heat network zoning** – This measure is expected to impact heat network developers, heat network supply chain businesses, heat consumers and new build developers, some of which may be SaMBs. Whilst no impacts are expected at primary legislation stage, there will be familiarisation and connection costs at secondary legislation stage. Familiarisation costs, as a proportion of existing costs, will likely be higher for SaMBs. However, an exemption from these requirements isn't appropriate given that large district heat networks will be deployed in zones, and the heat network developers and operators will be required to familiarise themselves with the legislation to ensure consumers received the best outcome.
- **2.10 Heat network market framework** – This measure is expected to impact businesses involved in the development, operation, or management of heat networks, some of which may be SaMBs. Whilst no impacts are expected at primary legislation stage, all heat suppliers will face familiarisation, dissemination, annual reporting, and administration costs at secondary legislation stage. Annual reporting costs will be proportionate to the number of heat networks managed by a heat network supplier, yet familiarisation costs will likely be a higher proportion of existing costs for SaMBs. Exemptions and mitigations will be considered at secondary legislation stage.
- **2.12 Smart appliances** – This measure is expected to impact a range of businesses, but the burden is expected to fall mostly on manufacturers which are typically large businesses. However, we expect that SaMBs could be affected as part of the supply chain and as service providers. Whilst no impacts are expected at primary legislation stage, there will be familiarisation and compliance costs at secondary legislation stage, which could represent a higher proportion of existing costs for SaMBs. Our initial assessment is that these costs will be small, but mitigations are considered in the full assessment in annex 2.12.

⁴⁶ Present value, discounted to 2022, 2020 prices.

3. Wider impacts

The wider impacts section in each of the impact assessments listed in annexes 1-3 vary as impacts assessed have been selected based on their relevance to each policy. The most common across the Bill are judicial impacts, human rights impacts, distributional impacts, equality impacts and competition impacts. A detailed assessment is provided in annexes 1-3 and a summary of equalities impacts is outlined below.

3.1 Equalities impacts

The Public Sector Equality Duty (PSED) under the Equality Act (2010) requires public authorities and others to carry out public functions to have due regard to:

1. Eliminate unlawful discrimination, harassment, victimisation and any other conduct prohibited by the Equality Act 2010
2. Advance equality of opportunity between people who share a protected characteristic and people who do not share it
3. Foster good relations between people who share a protected characteristic and those who do not

The equalities impacts across the bill are varied. A summary of the equalities assessments is provided in each of the impact assessments listed in annexes 1-3. There are eight measures which have impacts from the primary legislation and the equalities impacts of these measures are summarised below. Most measures will only have impacts after secondary legislation and any equalities impacts will be reviewed ahead of the final stage impact assessments for secondary legislation.

Analysis of equalities impacts of measures that have primary legislation impacts

- **CO₂ transport and storage regulatory investment (TRI)** (annex 1.1) – The primary legislation alone is not expected to have any impact on different protected characteristics groups.
- **Hydrogen heating village trial** (annex 1.3) – Proposed changes to the legislation will not directly disadvantage participants due to any protected characteristics they may have. While we cannot rule out the possibility that powers of entry may need to be exercised more frequently upon certain groups, the Gas Distribution Networks will be required, under the overall trial framework and reinforced by secondary powers, to exercise appropriate duty of care for each consumer within the trial area, which should address any variation in engagement needs between different groups.
- **Special merger regime for energy network companies** (annex 2.1) – There will be very minimal direct impact on individuals and the analysis does not indicate there are equality issues to address.

- **Energy industry code reform** (annex 2.2) – We expect there will be no impact on any protected characteristic from this measure.
- **Multi-purpose interconnectors** (annex 2.3) – The introduction of multi-purpose interconnectors as a distinct licensable activity does not have any equalities impacts. Any disproportionate impacts from individual projects would be expected to be mitigated through local planning and consenting processes.
- **Defining electricity storage** (annex 2.4) – We expect there will be no impact on any protected characteristic from this measure.
- **Final stages of nuclear decommissioning** (annex 3.2) – This measure is not expected to have any differential impacts on any of the protected characteristics groups.
- **Downstream oil resilience** (annex 3.3) – There are no anticipated impacts on any protected characteristics from this measure.
- **Pension reform for the Nuclear Decommissioning Authority (NDA) estate** (annex 3.9) – We do not consider there to be any differential impact to persons with protected characteristics.
- **Offshore wind environmental improvement package** (annex 3.10) - This measure is not expected to have any differential impacts on any of the protected characteristics groups.

4. Monitoring & evaluation

Monitoring & evaluation (M&E) plans are not uniform across the Bill. This is because the policies within the Bill have a wide range of objectives, metrics to evaluate these objectives, stakeholders, and external factors which may impact the success of the policy. Instead, a bespoke and proportionate approach is being taken to the M&E plan of each policy in the Bill, to tailor to individual policy requirements. M&E plans specific to each policy is presented in the impact assessments listed in annexes 1-3 and a summary of M&E plans of policies that have impacts from primary legislation is provided below.

M&E summaries of measures that have primary legislation impacts

- **CO₂ transport and storage regulatory investment (TRI)** (annex 1.1) – A M&E plan will be devised in full detail alongside the implementation of the regulatory framework, following finalisation of the T&S business model, the outcomes of CCUS cluster sequencing process and the enactment of any secondary legislation.
- **Hydrogen heating village trial** (annex 1.3) – Government will monitor any instances where the additional powers of entry need to be used, working with the Gas Distribution Network Operators (GDNs) to ensure that they are being used proportionately while fulfilling their intended purpose. Should Government become aware of any unforeseen instances where powers of entry are being used disproportionately, it will take action to ensure that such instances are prevented in future, including through the Secretary of State's new powers to make regulations by Statutory Instrument.
- **Special merger regime for energy network companies** (annex 2.1) – A post implementation review (PIR) will be carried out after five years following a proportionate approach, involving establishing whether there have been any attempted mergers in energy networks over that five-year period. To inform this PIR, the Department may collect evidence from stakeholders, such as the CMA, Ofgem and network companies, to find out how this policy has been implemented into their processes and the effect it has had on how they operate.
- **Energy industry code reform** (annex 2.2) – To provide a full understanding of policy intervention, it is deemed proportionate to carry out two evaluations: a lighter-touch process evaluation at the time of implementation, followed by a value-for-money performance evaluation 5 years following implementation, when it is expected there will be sufficient experience of the new governance arrangements to assess their performance and desirability.
- **Multi-purpose interconnectors (MPIs)** (annex 2.3) – Given the relatively small number of MPI projects in development currently, it is envisaged the Department will continue engagement with all relevant stakeholders to understand the impact of introducing MPIs as a new licensable activity. At present it is still premature to develop detailed M&E plans for MPIs policies because the full regulatory framework is not yet complete.

- **Defining electricity storage** (annex 2.4) – M&E will be carried out informally via stakeholder feedback to the Department and our Smart Systems and Flexibility Monitoring Plan. Both will enable the impact of policy intervention to be considered holistically against the range of other measures we are taking.
- **Final stages of nuclear decommissioning** (annex 3.2) – The proposed Decommissioning Exclusion Regulations and the new delicensing procedures are not expected to be used on any significant scale until 2032. The first evaluation review of these regulations will take place around 10-12 years after they come into effect. Monitoring data will be annually reported to the Department by the Office for Nuclear Regulation (ONR) on the number of successful applications for the Decommissioning Exclusion and delicensing. Estimated excavation and transport savings will be monitored by the Department as licensees of successful applications for permits to dispose of material on-site report annually. The Department will also monitor the impact of the LLW Exclusion, it is expected that the exclusion will be used within 1-2 years of implementation, resulting in savings to operators of the relevant sites. Evaluation activities to review the LLW Exclusion will be carried out five years after implementation, in line with the expectations set out in the Small Business, Enterprise and Employment Act 2015.
- **Downstream oil resilience** (annex 3.3) – It is difficult to assess clear data points that will demonstrate that the changes in this policy are working as it is focused on reducing the impact of extreme events. The Department will continue to communicate with industry to understand changes to their risk assessments due to these policy changes and whether this might flow through directly or indirectly to the market. The Department will undertake a post-implementation review of the policy in five years' time if sufficient market events have warranted it.
- **Pension reform for the Nuclear Decommissioning Authority (NDA) estate** (annex 3.9) – Monitoring will begin once the intervention commences, and an impact evaluation could be completed at the end of year 5 to give long enough for the anticipated impacts to be realised and any issues identified in the monitoring to be sufficiently resolved. Pension schemes are also required to carry out an actuarial valuation every three years.
- **Offshore wind environmental improvement package** (annex 3/10) – Industry can contribute to the monitoring of the effectiveness of the measures. The Marine Recovery Fund may also be used to collate and analyse data from this monitoring. The programme of work will be independently evaluated by external contractors. Impact evaluation will measure whether the desired outcomes have been met. Impact evaluation will be complimented by process evaluation to understand how and why the intervention is or is not working and for whom to provide evidence to inform policy amendment.

Annexes

Annex 1: Impact assessments under pillar 1 ‘liberating private investment in clean technologies’

- Annex 1.1: CO₂ transport and storage regulatory investment (TRI) impact assessment
- Annex 1.2: Fusion regulation impact assessment
- Annex 1.3: Hydrogen heating village trial impact assessment
- Annex 1.4: Hydrogen and industrial carbon capture (ICC) business model impact assessment
- Annex 1.5: Hydrogen levy impact assessment
- Annex 1.6: Clean heat market mechanism impact assessment
- Annex 1.7: Supporting nuclear derived fuels (NDFs) and recycled carbon fuels (RCFs) through the Renewable Transport Fuel Obligation (RTFO) impact assessment

Annex 2: Impact assessments under pillar 2 ‘reforming our energy system and protecting consumers’

- Annex 2.1: Special mergers regime impact assessment
- Annex 2.2: Energy industry code reform impact assessment
- Annex 2.3: Multi-purpose interconnectors impact assessment
- Annex 2.4: Defining electricity storage impact assessment
- Annex 2.5: Smart metering rollout impact assessment
- Annex 2.6: Future system operator impact assessment
- Annex 2.7: Smart secure electricity systems impact assessment
- Annex 2.8: Smart heat pumps impact assessment
- Annex 2.9: Heat network zoning impact assessment
- Annex 2.10: Heat network market framework impact assessment
- Annex 2.11: Energy company obligation (ECO) buyout mechanism impact assessment
- Annex 2.12: Smart appliances impact assessment
- Annex 2.13: Onshore electricity network competition impact assessment
- Annex 2.14: Smart chargepoints impact assessment
- Annex 2.15: Energy performance of buildings impact assessment
- Annex 2.16: Energy saving opportunity scheme (ESOS) impact assessment

Annex 3: Impact assessments under pillar 3 ‘ensuring the safety, security and resilience of the energy system’

- Annex 3.1: Accession to the Convention on Supplementary Compensation (CSC) for nuclear damage impact assessment
- Annex 3.2: Final stages of nuclear decommissioning impact assessment

- Annex 3.3: Downstream oil resilience impact assessment
- Annex 3.4: Oil and Gas Authority (OGA) ex ante powers impact assessment
- Annex 3.5: Application to the territorial sea of requirement for nuclear site licence impact assessment
- Annex 3.6: Offshore oil & gas (habitats assessment and emergency pollution planning & response) impact assessment
- Annex 3.7: Offshore oil & gas decommissioning cost recovery impact assessment
- Annex 3.8: Civil nuclear constabulary (CNC) impact assessment
- Annex 3.9: Pensions reform for the Nuclear Decommissioning Authority (NDA) impact assessment
- Annex 3.10: Offshore wind environmental improvement package impact assessment

All Impact Assessments for individual measures are available on the Energy Bill webpage.
